

FL-01: AI Workflow Audit and Tool Setup

Vikas Kumar Prajapati · General AI Fluency Track · Week 1

1. Recurring Task Audit

Task	Classification	Rationale
Debugging IntelliPlant backend (Reflex / FastAPI / Gemini)	Collaborate with AI	AI spots error patterns fast, but compliance-matching logic needs my judgment to verify against real behavior.
Writing ingestion/parsing code for IntelliPlant	Collaborate with AI	Boilerplate and library syntax move faster with AI; pipeline design decisions stay mine.
Tailoring resume/CV to a specific job posting	Delegate to AI with review	AI is fast at ATS keyword matching and rewording, but I fact-check every claim before sending.
Writing LinkedIn posts about a shipped project	Delegate to AI with review	AI drafts a decent first pass; I rewrite the voice so it doesn't sound corporate.
UI/UX design decisions for freelance client work	Just me	Client trust and my design taste are the actual product I'm being paid for.
Freelance client communication and scoping calls	Just me	Relationships and negotiation can't be delegated without losing the trust that gets me repeat work.
Studying core CS subjects (e.g. Compiler Design viva prep)	Collaborate with AI	AI as a quizzing partner speeds recall, but the actual understanding has to be mine for the exam.
Reviewing / merging GSSoC'26 open-source PRs	Just me	Code-quality and community-standard calls are an accountability decision I shouldn't hand off.
Writing YouTube documentary scripts	Delegate to AI with review	AI gives a fast structural draft; I heavily rewrite for the channel's voice and pacing.
Editing YouTube footage and audio sync	Just me	The editing choices are the channel's actual style and can't be automated without losing identity.
Generating AI narration audio for videos	Fully automate	Mechanical text-to-speech step with no judgment call once the script is locked.
Writing README/documentation for shipped projects	Delegate to AI with review	AI drafts structure and boilerplate quickly; I check accuracy against the actual code.
Learning a new framework/library (e.g. Reflex basics)	Collaborate with AI	AI explains concepts on demand, but I only really learn by building and hitting real errors myself.
Tracking freelance deadlines and invoice reminders	Fully automate	Pure scheduling logic, zero judgment needed once the rules are set.
Deciding portfolio narrative across resume/CV variants	Just me	This is how I present my own identity across dev vs. design roles; it has to reflect my real judgment.

2. Toolkit Setup

Claude, ChatGPT, and Anthropic Academy accounts created. Enrolled in AI Fluency: Framework & Foundations and completed Module 1.

[Attach Academy completion screenshot separately in submission]

3. Claude Project — Custom Instructions

Who I am: A CS student who also does freelance design work and full-stack development, currently juggling coursework, a hackathon project, and an open-source contribution.

Tone preferences: Direct and to the point, no filler or corporate phrasing. Push back if something I say is vague, wrong, or missing context, instead of just agreeing.

Current goals: Finish my current build in stages rather than all at once, land a developer or design role after graduation, and keep my application materials sharp and up to date.

Screenshot: configured Claude Project with custom instructions saved.

4. Three Target Tasks (reused in FL-02 – FL-04)

1. Debugging IntelliPlant code (Collaborate with AI)

Done well means: I can explain the root cause in my own words before accepting a fix; the fix is verified against a test case or manual repro; no code is merged that I can't explain line by line.

2. Tailoring resume/CV to a job description (Delegate to AI with review)

Done well means: every AI-suggested claim is checked against my real experience; the draft covers at least 80% of the JD's core keywords; it still fits one page and sounds like me when read aloud.

3. LinkedIn / README project write-ups (Delegate to AI with review)

Done well means: the AI draft is used only as scaffolding; I rewrite tone and voice throughout; the post/README ships within a day of finishing the project, not weeks later.
